Human locked exercise - ready for independent completion

The assignment requires a human-authored AI-off prediction BEFORE execution. This guide supplies workflow only. No human prediction, authorship declaration, precommit or diagnosis has been invented. The professor's reported Edition A AI exception does not waive this separate requirement.

Before closing AI

Use the versioned repository at outputs/AAPL-research, active folder project1_refresh_2026. The standalone folder is not itself a Git checkout. Confirm Git has YOUR identity configured before committing your authored record. Do not use the assistant's author identity. You can use the bundled Python path shown in Start-AAPL.cmd if python is unavailable. Preserve the existing assistant technical test separately.

Complete with AI closed

1. Open a terminal in the repository's project1_refresh_2026 folder. Run python locked_test.py prepare. Choose a material scalar input from model.BASE; supply your own new value, units, predicted direction, reasoning, rough size and decision effect. Do not reuse an AI prediction. Model ratio values use decimals; inspect the input definition before entering units.

2. Review docs/locked-precommit.json without running the scenario. From the repository root, git add project1_refresh_2026/docs/locked-precommit.json and git commit -m "Preserve my AI-off changed-input prediction". Keep the printed commit hash. If Git asks for identity, configure your own identity and finish the commit before execution.

3. Return to project1_refresh_2026 and run python locked_test.py run. The helper rejects an uncommitted prediction, mismatched protected files or an existing run. It preserves old/new input, hashes, timestamps, before/after valuation and the model rule's action.

4. Still with AI closed, run python locked_test.py review. Write your actual explanation of direction, any failure or no-change reason and YOUR committee decision after the result. The model's automated watch rule is distinct from your initiate judgment. Explicitly say whether your own judgment changed and why.

5. Commit both JSON records using your own identity. Keep the record unchanged. If you make an error, preserve the failed attempt and add a dated explanation; do not backdate or rewrite prediction history.

After completing the independent exercise, reopen AI and provide the two records/commit for validation and incorporation into Validation-and-AI-Use.pdf. The assistant can then check integrity and document the actual result without authoring your prior prediction. This exercise remains OPEN until those genuine records exist.
