Partner review - Alex Schwanke and Jess Tran

Exchange: October 16, 2026. Presenter Alex Schwanke; reviewer Jess Tran. Alex's version label:1, not a verified Git hash. Alex confirms AI was closed during the exchange. Exact time was not supplied. This is a record of reported events plus separately labeled analytical completion, not a claim of an independently observed conversation.

Actual feedback received

Jess asked how Apple's AI ventures drive valuation and questioned the ORIGINAL0.57% annual FCFF growth assumption because it seemed low. Alex's answer was that Apple is adapting to AI without putting all its eggs in one basket. Jess summarized his conclusion as valid in light of the new Siri AI information. She identified a strength: reassessing the valuation using new information. She also asked how AI would influence the growth rate.

The exact new information was Apple's September 14,2026 Siri AI release. A later source check identified that this postdated the original October 31,2025 valuation. Alex expressly elected to move the active valuation to September 14,2026 close. This corrects a date/basis issue; it is not a retrospective claim that the2026 release was known in2025.

Alex's reversal condition: disappointing Apple AI features. His stated disposition: keep INITIATE, and re-evaluate all assumptions. No specific numerical replacement rate was supplied by Jess or accepted during the exchange. The refresh now derives FCFF from operating forecasts; no blanket0.57% growth input remains in the active engine. Existing technical AI tests must not be credited as Alex's human AI-off locked prediction or as a meeting-time rerun.

Evidence actually reported as checked

Alex reports checking balance-sheet and income-statement inputs in Apple's10-K, plus Yahoo Finance for beta and Treasury risk/rate information. He did not recall exact pages, external field definitions, values or observation dates. The assistant located the filing anchors afterwards in the separate source ledger; those page references are not invented memories of what Jess and Alex opened. The whole WACC is not certified by a10-K check alone. The refresh uses a new dated Treasury observation and an independently calculated beta diagnostic; those are not attributed to the earlier Yahoo check.

Analytical completion for the presentation

AI adoption may affect upgrades, mix and Services engagement. Revenue/margins feed EBIT; taxes and reinvestment feed FCFF; WACC and the bridge feed value. This mechanism and proposed numerical review triggers are analytical additions, not Jess's quotations. Range-dependent sensitivity comparisons are documented in the application.

Reciprocal review of Jess's NVIDIA analysis

Jess presented NVIDIA. Alex asked whether NVIDIA was betting too much on AI. His suggested improvement was to run a downside assumption/scenario for an AI bubble bursting. That is actual feedback, not a claim Jess ran the scenario. His positive feedback was her research beyond the central AI thesis.

Alex clarifies that he manually checked beta. The beta value, provider, observation date, return window/definition and comparison result were not supplied. Beta is a market estimate, not a10-K balance-sheet or income-statement figure; no complete WACC verification is certified. His earlier broader recollection of a10-K check remains unverified rather than being used as a beta source. Alex reports no additional model/valuation or sensitivity questions.

Jess's limitation and explanation-back clarification

Jess challenged whether Siri AI was overhyped: a buzzword without real utility. She recommended investigating what Siri actually brings to Apple. Alex reports the main driver as Services revenue and the biggest limitation as falling behind in AI. In context these remarks address Alex's Apple thesis; they are not assigned to NVIDIA or used to invent Jess's NVIDIA buy/sell recommendation. Alex reports no misunderstanding requiring correction.

The reciprocal NVIDIA explanation-back remains undocumented: Jess's actual investment recommendation, main driver and biggest limitation were not supplied. Record the coverage honestly; the newly supplied Apple feedback does not fill that separate NVIDIA field. Exchange time and exact beta-check evidence remain unspecified.

Disposition and actual changes

Keep: Alex's initiate judgment and qualitative AI-adoption thesis. Reassess: original flat FCFF growth, category assumptions, R&D/capital needs, terminal growth duration, and WACC. Correct: align the valuation date with the cited Siri evidence and refresh the market/financial base together. No in-meeting numerical change or completed human locked run is claimed.

Core DCF remains below price. Extended-duration cases require stronger growth persistence. Jess is credited for challenging growth; refreshed numerical assumptions are the analyst's responsibility.
